

Land class mapping process flow - CO

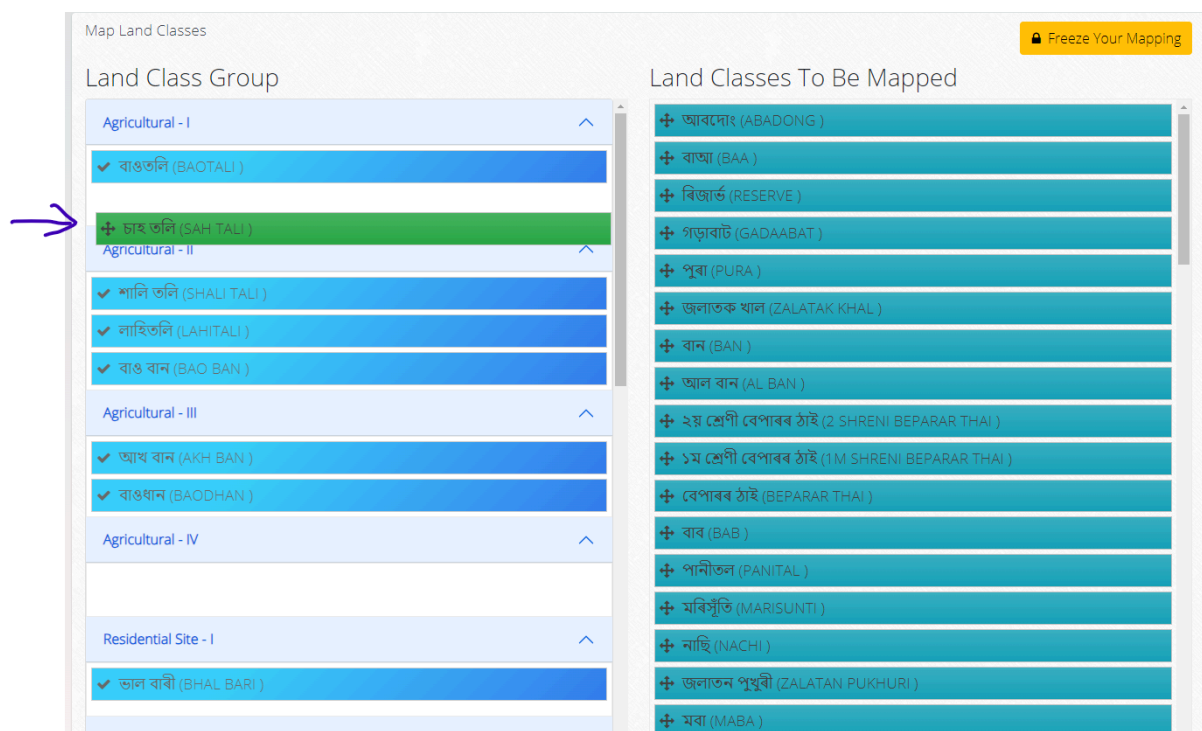

In the left section with the 'tick' mark represents, those are default mapping and one can not modify or perform any action on those classes.

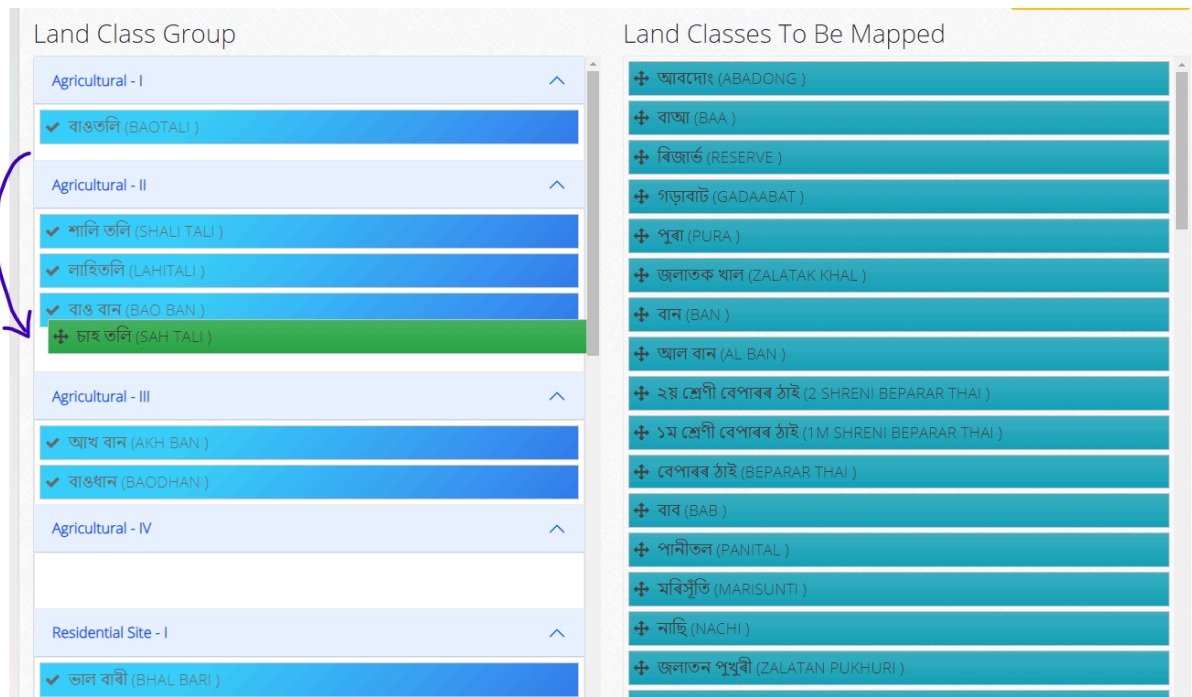

From the right section, CO has to drag and drop the classes to the left under the actual group. You can find the examples below

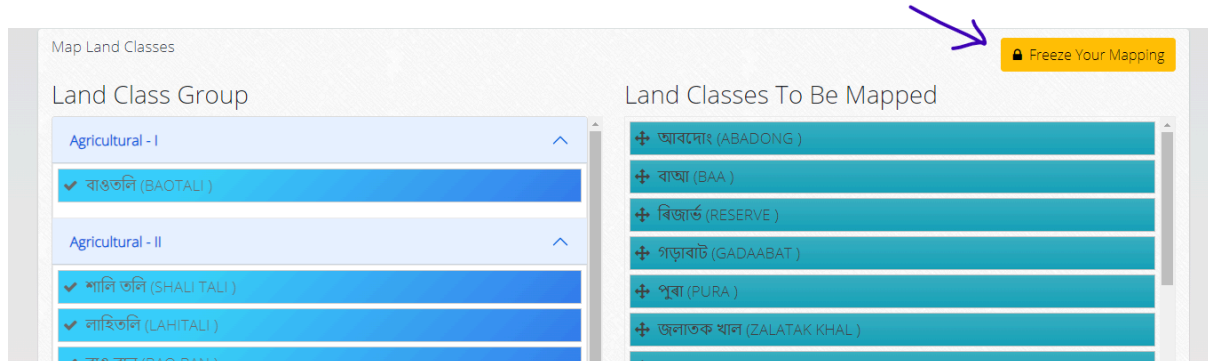

You are free to move the mapped class into another group by drag & drop. Suppose, you mapped the “SAH TALİ” under “Agriculture - I”, then you realise that class will be under “Agriculture - II”. Then you just drag that class to “Agriculture - II”. Please check the below screenshots.

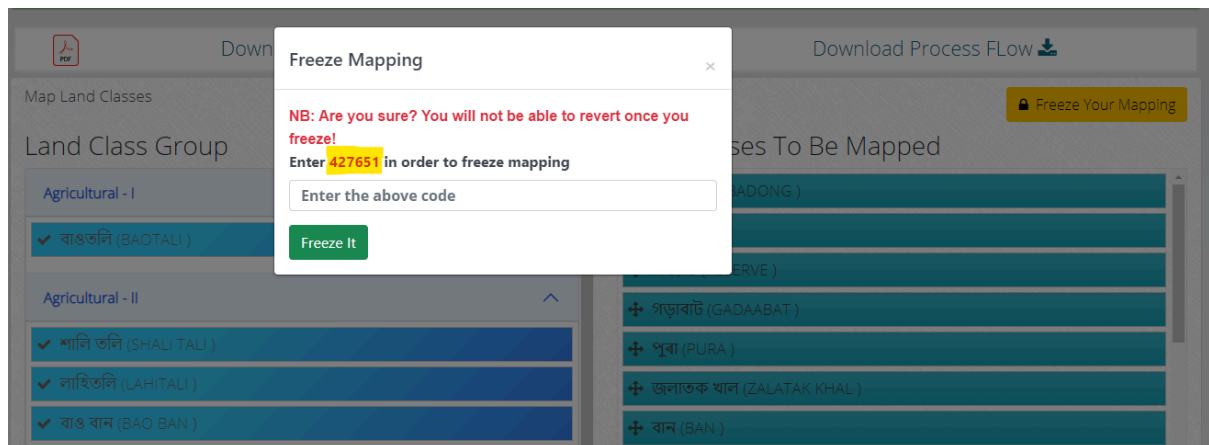

You can follow this process until you freeze your mapping. For freezing, you have to map all classes. You can find the freeze button on the top right corner.

On freezing, the system will ask to put a code which will be visible on the freezing pop-up. Check the screenshot, there you can find the yellow area, which is covered by the code. That code you will have to put and click the “Freeze” button.

After freezing you will get the below screen
