

Patta type mapping process flow - CO

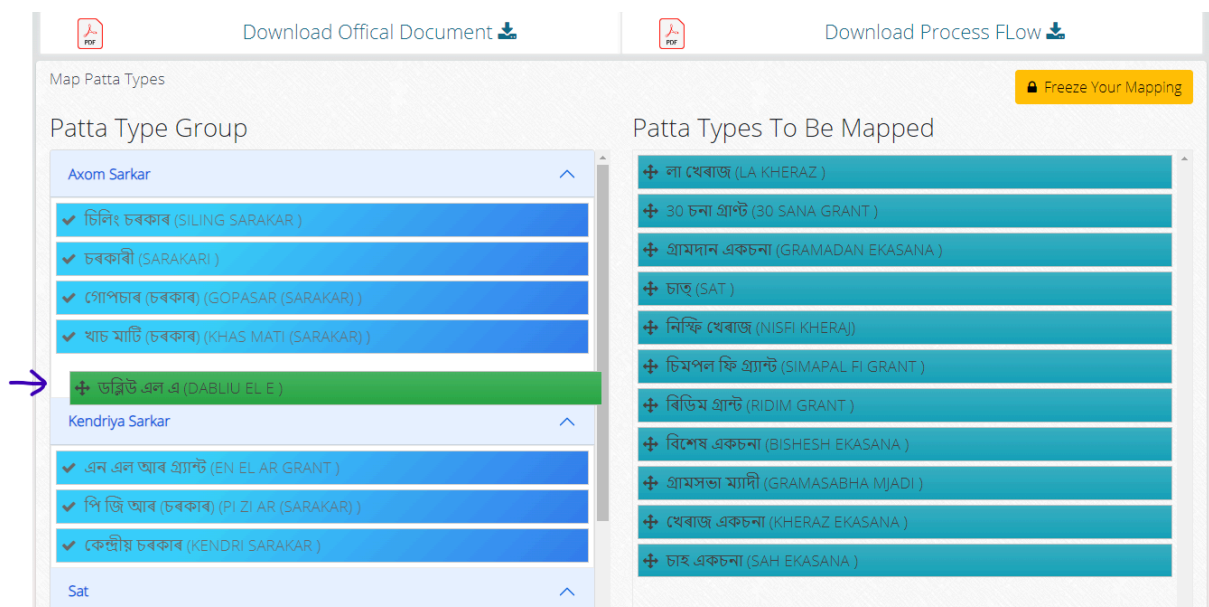

In the left section with the 'tick' mark represents, those are default mapping and one can not modify or perform any action on those patta types.

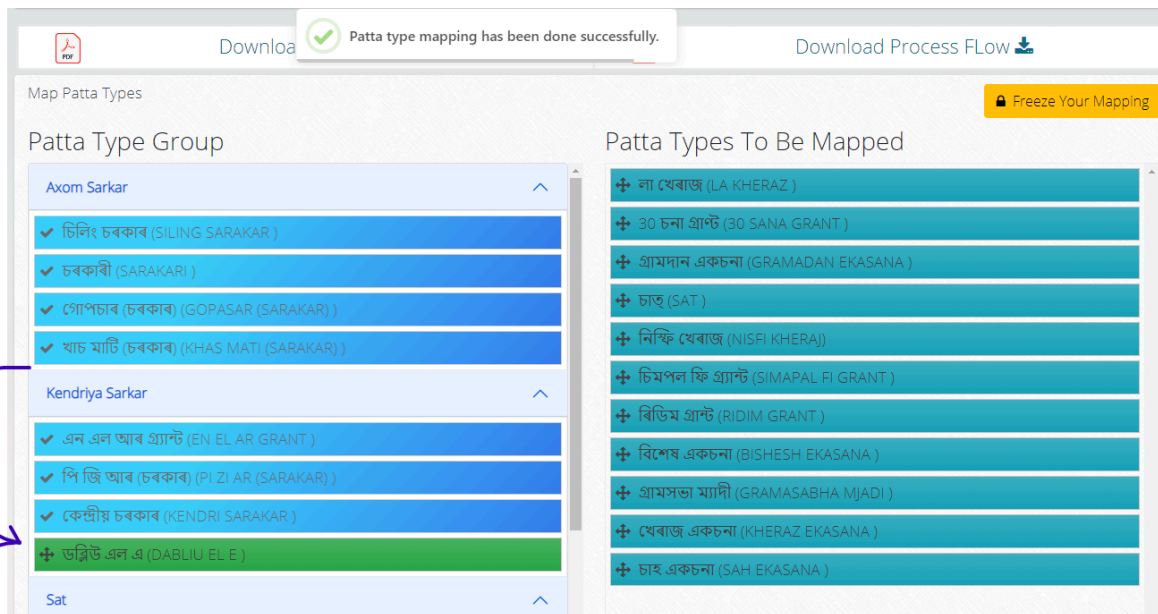

From the right section, CO has to drag and drop the patta types to the left under the actual group. You can find the examples below

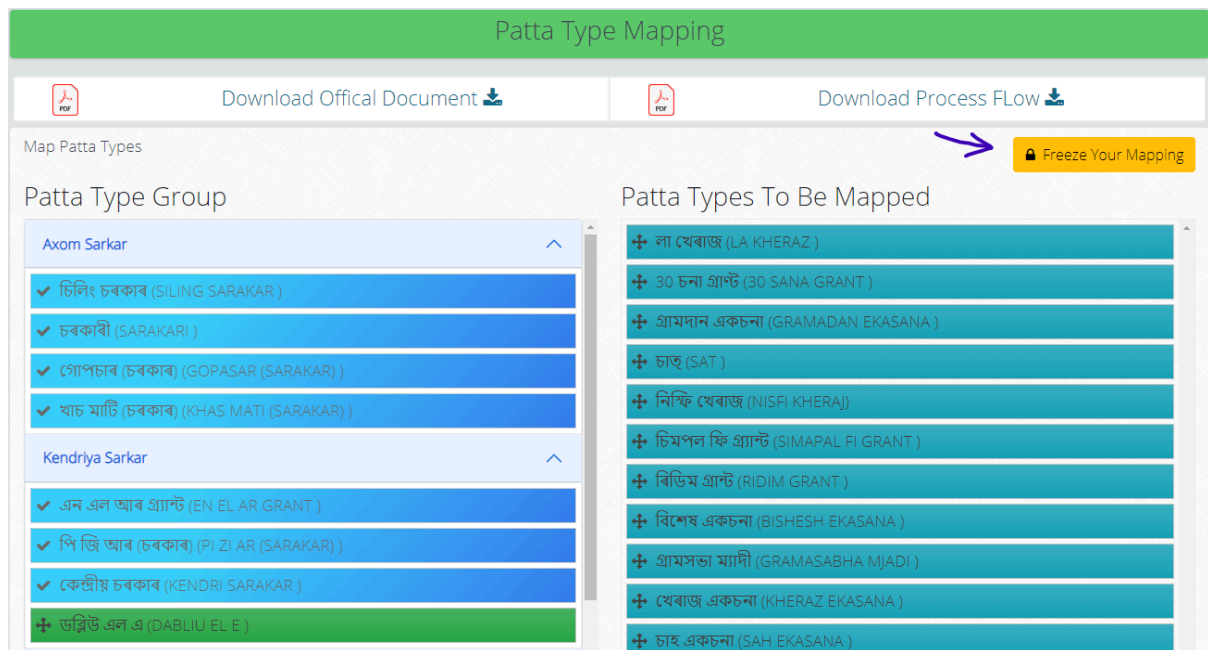

You are free to move the mapped patta types into another group by drag & drop. Suppose, you mapped the “DABLIU EL E” under “Axom Sarkar”, then you realise that patta type will be under “Kendriya Sarkar”. Then you just drag that class to “Kendriya Sarkar”. Please check the below screenshots.

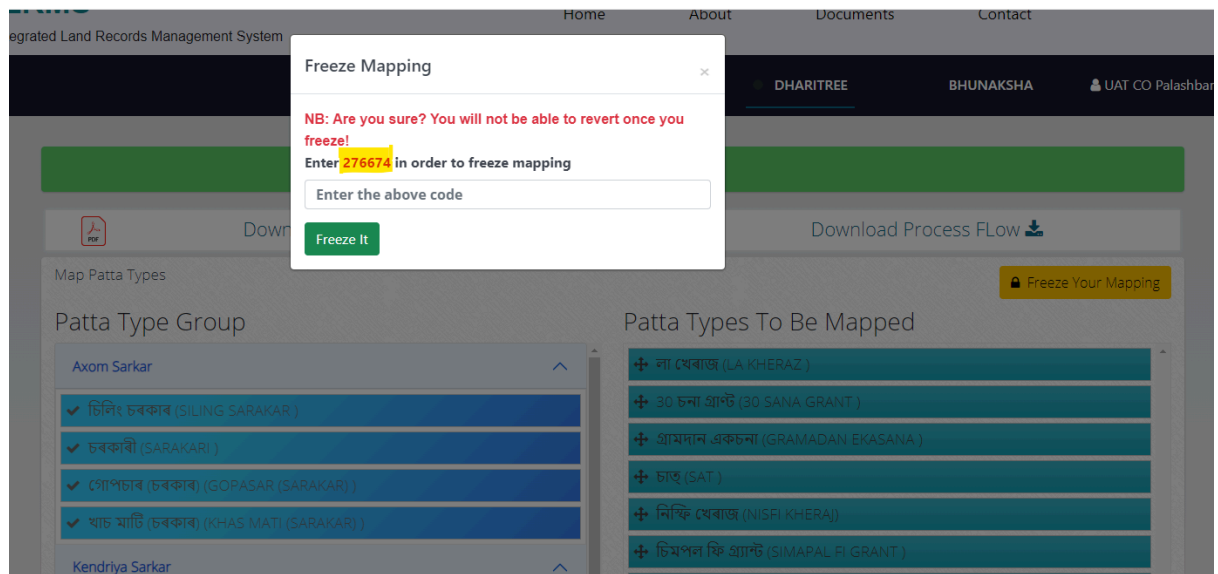

You can follow this process until you freeze your mapping. For freezing, you have to map all patta types. You can find the freeze button on the top right corner.

On freezing, the system will ask to put a code which will be visible on the freezing pop-up. Check the screenshot, there you can find the yellow area, which is covered by the code. That code you will have to put and click the “Freeze” button.

After freezing you will get the below screen
